BAHAGIAN 1: GAMBARAN MENYELURUH KAJIAN

SECTION 1: OVERVIEW OF STUDY

1.1	Latar belakang ringkas dan kewajaran projek (Tidak melebihi 300 perkataan) <i>Brief background and justification of study (Not more than 300 words)</i>
	<p>WorldFish aims to increase aquaculture productivity and human wellbeing in Bangladesh through its rohu, catla and silver carp genetic improvement programs. These programs use a family-based selective breeding approach, which allows rapid genetic improvement, while controlling inbreeding and maintaining genetic variation in its breeding population.</p> <p>Currently WorldFish nurses – from spawning until fish are large enough to be tagged with passive integrated transponders – each carp family in a separate un-replicated hapa (i.e.net). Common environmental effects resulting from separate nursing of full-sibling families are difficult to quantify, are difficult to account for in genetic analysis and potentially result in suboptimal responses to selection (i.e. genetic gains). An alternative, and potentially superior approach to nursing families in hapas, is to communally rear fish, obtain tissue samples at the time of tagging and reconstruct the pedigree (i.e. assign parentage) of each fish using molecular genetic markers. WorldFish is currently developing Single Nucleotide Polymorphism (SNP) panels for this purpose. Communal early rearing (CER) in combination with pedigree reconstruction allows families to be kept together from very early in life, avoiding or reducing common environmental effects associated with separate early rearing (SER). Furthermore, it can allow the number of families (including half-sibling families) to be increased without a need for additional facilities, thus increasing the precision of genetic parameter estimates (e.g. additive and non-additive genetic variances, heritabilities and genetic correlations), selection accuracy and ultimately response to selection (Ninh et al., 2011).</p>

1.2	Adakah kajian yang serupa sedang/pernah dijalankan oleh penyelidik atau penyelidik lain? (Jika ya, sila berikan butiran dengan kata kunci (maksimum 3 penerbitan penuh) perlu dikemukakan bersama-sama borang permohonan) <i>Have similar studies been undertaken by you or others currently /previously?</i> <i>(If yes, give details with key references (maximum of 3 full publications) must be submitted together with the application form)</i>
------------	--

**BORANG PERMOHONAN KATEGORI AKUATIK
(AQUATIC CATEGORY APPLICATION FORM)**

Results from this study will be specific to WorldFish Genetically Improved Catla and the SNP panel used for parentage assignment. However, similar studies have been conducted in other species and breeding populations (Ninh et al., 2011).

1.3 Matlamat kajian (Senaraikan matlamat umum dan khusus)

Study objectives (List general and specific objectives)

The objective of the study is to validate the use of a catla SNP panel for parentage assignment and compare progeny test results using communal early rearing (CER) and separate early rearing (SER) methods on Generation 1 WorldFish Catla Genetic Improvement Program families.

Specific objectives are to determine if:

- individuals can accurately and unambiguously be assigned using SNP markers
- pools of two samples from different catla individuals allow accurate and unambiguous parentage assignment
- equal numbers of individuals per family are present at tagging under CER
- the genetic correlation between CER harvest weight and SER harvest weight equals one

1.4 Hipotesis kajian

Study hypothesis

The null hypotheses to be tested are:

- Parentage of catla individuals can accurately and unambiguously be assigned using SNP markers (maximum likelihood method of assignment applied to SER fish) (Hamilton, 2021),
- Parentage of catla pools of two individuals can accurately and unambiguously be assigned using SNP markers (maximum likelihood method of assignment applied to SER fish) (Hamilton, 2021),
- There are equal numbers of individuals per family at tagging (within spawn runs) under CER (chi square test), and
- The genetic correlation between CER harvest weight and SER harvest weight equals one (likelihood ratio test) (Gilmour et al., 2014; Hamilton et al., 2022).

1.5 Berikan ringkasan rekabentuk kajian menggunakan CARTA ALIR (Sila masukkan kumpulan, spesies, bilangan dan umur haiwan yang digunakan, kaedah, tempoh kajian dan parameter-parameter kajian).

**BORANG PERMOHONAN KATEGORI AKUATIK

Finfish', 'Sedation and Anaesthesia' and 'Weight and Length Measurement' Standard Operating Procedures (WorldFish, 2019c; d; e).

**BORANG PERMOHONAN KATEGORI AKUATIK
(AQUATIC CATEGORY APPLICATION FORM)**

1.6 Kewajaran penggunaan haiwan.
Justification of using animals

The use of the catla for this experiment is justifiable in accordance with The Principles of Humane Experimental Techniques (Flecknell, 2002):

Replacement

- No non-sentient alternative can be used to replace the catla and still achieve the study objectives (see section 1.3).

Reduction

- All fish used in this trial will form part of the WorldFish Catla Genetic Improvement Program population and will be progeny tested and have their data analyzed as part of routine genetic improvement activities. To achieve genetic gain in such programs – requiring the estimation of breeding values to identify superior individuals (i.e. candidate parents of the next generation) – it is necessary to test a large number of individuals. The greater the number of individuals tested, the greater the selection intensity applied in the selection of new parents and the greater the genetic gains achieved in the next generation (Falconer and Mackay, 1996; Gjedrem and Baranski, 2009). However, the ‘law of diminishing returns’ applies – doubling the number of individuals tested does not result in double the genetic gains. Accordingly, WorldFish has adopted 50 individuals per family as its standard for progeny testing to achieve a high level of genetic gain without requiring the use of an excessive number of animals.

Refinement

- All staff involved in spawning, overseeing the on-farm grow out and sampling the catla at harvest are trained and competent in fish husbandry and handling.
- The number of individuals per family tagged for from the CER has been limited to 1213 fish from 64 families (~19 per family *c.f.* the targetted 50 per family for the standard SER treatment). This will allow estimation of genetic correlations to determine if CER can be adopted in place of SER.
- Fish will be humanly euthanized and, where possible (i.e. of sufficient size and quality, after tag removal), sold for human consumption.

1.7 Potensi manfaat kajian.

Potential benefits of study.

- Meningkatkan kefahaman mengenai kesihatan haiwan/manusia
Increasing understanding of animal / human health
- Pengekalan/penambahbaikan kesihatan haiwan/manusia
Maintaining / improving animal / human health
- Penambahbaikan pengurusan haiwan
Improving animal management
- Lain-lain (sila nyatakan):
Others (please specify):

Routine adoption of CER and parentage assignment using molecular markers has the potential to improve the precision of genetic parameter estimates and response to selection (i.e. genetic gains) (Ninh et al., 2011) in the WorldFish Catla Genetic Improvement program.

Name of manufacturer

See Section 2.8.4

Two feeding treatments will be applied – low input and high input (see Section 2.8.4 for details). The low input treatment reflect historic and current feeding regimes applied by poor small-scale farmers in Bangladesh. The high input treatment reflect practices increasingly adopted in Bangladesh as aquaculture production is intensified.

Fermented mustard oil cake (MOC): fermented residue from commercial mustard oil or meal production. Up to 1.2 g / m² / week (50 g / decimal / week) will be used.

Apply urea at a rate of 2 g / m² / week (81 g / decimal / week) and triple superphosphate at a rate of 2 g / m² / week (81 g / decimal / week). The rate of fertiliser application will be increased if Secchi disc visibility is greater than 30 cm.

MOC and fertiliser promote natural feed growth (e.g. plankton)

Commercial feed will be Mega Pre Starter

Adakah makanan mengandungi sumber porsin?

Does the feed contains porcine ingredients?

- Tidak/No
- Ya/Yes
- Tiada maklumat/No information

**BORANG PERMOHONAN KATEGORI AKUATIK
(AQUATIC CATEGORY APPLICATION FORM)**

Describe the end-point of the study (at what instance would you sacrifice the animal, if there is any difference from the original plan) E.g. Disposed / consumed after withdrawal period....

Approximately 80% of all stacked fish will be culled after the harvest-age measurement and the candidate parents have been indentified. Culling will be done according to WorldFish Standard Operation Procedures. Where fish are of market standard, they will be sold for human consumption.

3.3 Penggunaan Bahan Berbahaya (jika berkaitan).

Use of hazardous agents (if applicable).

3.3.1 Adakah bahan berbahaya digunakan? Ya Tidak
Is any of the hazardous agents used? Yes No

Jika Ya, teruskan dengan soalan berikutnya.
If yes, please proceed to the following questions.

3.3.2 Jenis bahan berbahaya.
Types of hazardous agents.

Organisma patogen
Pathogenic organism

Nama patogen
Name of pathogen

Karsinogen kimia
Chemical carcinogen

Nama karsinogen kimia
Name of chemical carcinogen

Dos
Dose

Cara administrasi
Route of administration

Kekerapan
Frequency

RNA/DNA rekombinan
Recombinant RNA/DNA

Bahan radioaktif
Radioactive material
